50 **Figure S4** UHPLC-MS chromatograms of the cysteine degradation products of *C.*
 51 *songaricum* and peanut skin. UHPLC(-)MS in MRM mode with precursor ion 694 and
 52 product ion 573 targeting at procyanidin A-cysteine conjugates.

53

54

55

56 **Figure S5** UHPLC-APCIMS chromatograms of triglycerides in the milk after
57 accelerated oxidation. From upper to lower: blank milk, procyanidin B1-containing
58 milk, procyanidin A1-containing milk, procyanidin A2-containing milk, catechin-
59 containing milk, and epicatechin-containing milk. The integral areas on the top of
60 each peak were automatically calculated and drawn by the UHPLC-MS instrument.
61 The values written in black are the area sums of chromatograph peaks with retention
62 times less than 4.28 (left of the vertical line) and that with retention times equal to and
63 larger than 4.28 (right of the vertical line).

64

66

67 **Figure S6** UHPLC-APCIMS of triglycerides in the milk after accelerated oxidation.

68 Upper: UHPLC-APCIMS chromatogram of blank milk; Lower: MS spectrum of the

69 peak at 4.28 min contains 4 triglycerides all of which have 44 of equivalent carbon

70 numbers. These triacylglycerols include SPC (Stearic, Palmitic and Capric acid), SMLa

71 (Stearic, Myristic and Lauric acid), OMM (Oleic, Myristic and Myristic acid), and

72 OPLa (Oleic, Palmitic and Lauric acid). SPC that contains fatty acids of 18:0/16:0/10:0

73 displayed $[M+NH_4]^+$ at 768.8 and product ions at 467.4 $[M+H-S]^+$ and 579.5 $[M+H-$ 74 $C]^+$. SMLa that contains fatty acids of 18:0/14:0/12:0 displayed $[M+ NH_4]^+$ at 768.875 and product ions at 467.4 $[M+H-S]^+$ and 551.5 $[M+H-La]^+$. OMM that contains fatty76 acids of 18:1/14:0/14:0 displayed $[M+NH_4]^+$ at 794.7 and product ions at 495.5 $[M+H-$ 77 $O]^+$ and 549.5 $[M+H-M]^+$. OPLa that contains fatty acids of 18:1/16:0/12:0 displayed78 $[M+NH_4]^+$ at 794.7 and product ions at 495.5 $[M+H-O]^+$ and 577.5 $[M+H-La]^+$.
